Submission Date	July 25, 2026

Feature Information

Feature Name: Knowledge Assistant

Feature Category: Generative AI & Agents

Databricks Release Phase: Beta

Brief Description: Knowledge Assistant is a Databricks feature that allows users to upload documents and ask natural-language questions about the document corpus. The system uses LLMs to search and synthesize information. Acme Health Plan is

evaluating for internal knowledge base Q&A (e.g., "What are our member eligibility rules?" or "Show me policies on diabetes coverage").

Use Case and Business Justification

What problem does this feature solve for Acme Health Plan?

Currently, Acme Health Plan has extensive documentation scattered across wikis, policy documents, and PDFs (eligibility rules, coverage policies, clinical guidelines, member FAQs). Business teams spend significant time searching for information manually or asking colleagues. Knowledge Assistant could centralize and speed up knowledge discovery, particularly for new team members and during onboarding.

Intended User Base:
- [x] Analytics teams | [ ] Data engineers | [ ] CISO/Security | [x] Clinicians/Claims | [x] Other: Benefits/Eligibility team, Member Services, HR

Expected Data Volume & Sensitivity:
- [x] >10M rows (large document corpus)
- PHI involved? [x] Yes | [ ] No
- Types: [x] Member IDs (in examples), [x] Claims (aggregate), [ ] Clinical Notes | [x] Other: Coverage policy references (might mention conditions)

Note: Initial pilot will use synthetic/redacted documents only; no real PHI.

Proposed Implementation

Timeline:
- Target start date: August 1, 2026 (sandbox pilot)
- Target production date: TBD (pending GA and full risk assessment)

Scope:
- [x] Pilot (≤5K rows, ≤90 days, non-PHI only)
- [ ] Limited rollout (specific teams/regions)
- [ ] Full production rollout

Dependencies:
- Databricks workspace with Beta Knowledge Assistant enabled (already provisioned)
- Document ingestion workflow (existing, uses Databricks File System)

Security & Compliance Scoping

Will this feature handle PHI?
[x] Yes | [ ] No | [ ] Uncertain

If yes, which categories (note: pilot is non-PHI only; this describes future intent):
[x] Member demographics | [x] Claims data | [ ] Clinical notes | [ ] Credentials | [ ] Genetic info | [ ] Other

Data Residency Requirements:
[x] On-premise | [x] AWS US-East | [ ] AWS region-specific | [ ] Multi-region | [ ] No requirement

Regulatory Triggers:
[x] HIPAA PHI handling (future; pilot is non-PHI)
[x] Third-party data sharing (LLM might be cloud-based; TRB needs to assess)
[ ] State data breach law | [ ] Cross-border transfer | [ ] None

---

Known Risks & Questions

What concerns do you anticipate?

1. **LLM Data Handling:** Documentation says Knowledge Assistant is "locally run" within Databricks workspace, but we need confirmation that prompts/documents are NOT sent to cloud-based LLMs (e.g., ChatGPT API). If they are, that's a HIPAA concern.
2. **PHI Leakage:** If Knowledge Assistant generates responses that include member identifiers or sensitive information (e.g., "Members with diagnosis X include John Doe, SSN 123-45-6789"), that's a breach risk.
3. **Document Upload:** Who can upload documents? If the wrong documents (real claims, provider credentials) are uploaded, they could be exposed.
4. **Audit Trail:** Can we track who asked what questions and what responses were returned? Important for breach investigation.

Which security controls are most critical?
- LLM data containment (confirm no data egress)
- PHI masking in responses (e.g., member ID but not name)
- Upload access control (limit to administrators)
- Audit logging (prompt + response tracking)
- Row-level access control (if member data is searched, only authorized users see results)

Documentation Provided

Attach or reference:
- [x] Architecture diagram: See Databricks Knowledge Assistant product documentation (link below)
- [x] Feature documentation: https://docs.databricks.com/en/generative-ai/agent-framework/knowledge-assistant/overview.html
- [ ] Preliminary security assessment: (Will be completed as part of TRB review)
- [ ] SLA or support agreement: Beta features have "best effort" SLA only

---

Checklist for Completeness

- [x] All fields above completed
- [x] Use case justification is clear
- [x] Data scope is quantified
- [x] Timeline is defined
- [x] Relevant documentation attached
- [x] Known risks identified

Submitter Certification:

I certify that the information provided above is accurate to the best of my knowledge, and I have authority to request this review on behalf of the Enterprise Architecture team.

Signature / Approval:
[Enterprise Architect] — Title: Enterprise Architect
Date: July 25, 2026

For TRB Use Only
